

Write To A File 🐍

Exercise 21 (and [Solution](#))

Take the code from the [How To Decode A Website](#) exercise (if you didn't do it or just want to play with some different code, use the code from the [solution](#)), and instead of printing the results to a screen, write the results to a txt file. In your code, just make up a name for the file you are saving to.

Extras:

- Ask the user to specify the name of the output file that will be saved.
